
Vaccines for the Rheumatic Disease Patient

Kevin L. Winthrop, MD, MPH
Professor, School of Public Health
Division of Infectious Diseases
Oregon Health & Science University

Disclosures

- Research funding from Pfizer, BMS
- Scientific consultant work for Amgen, Abbvie, Pfizer, UCB, Genentech, BMS, Lilly
- Data safety monitoring boards for RCTs conducted by UCB, Roche, Astellas, Lilly, Janssen, Galapagos, Sanofi, Regeneron

Vaccine Development

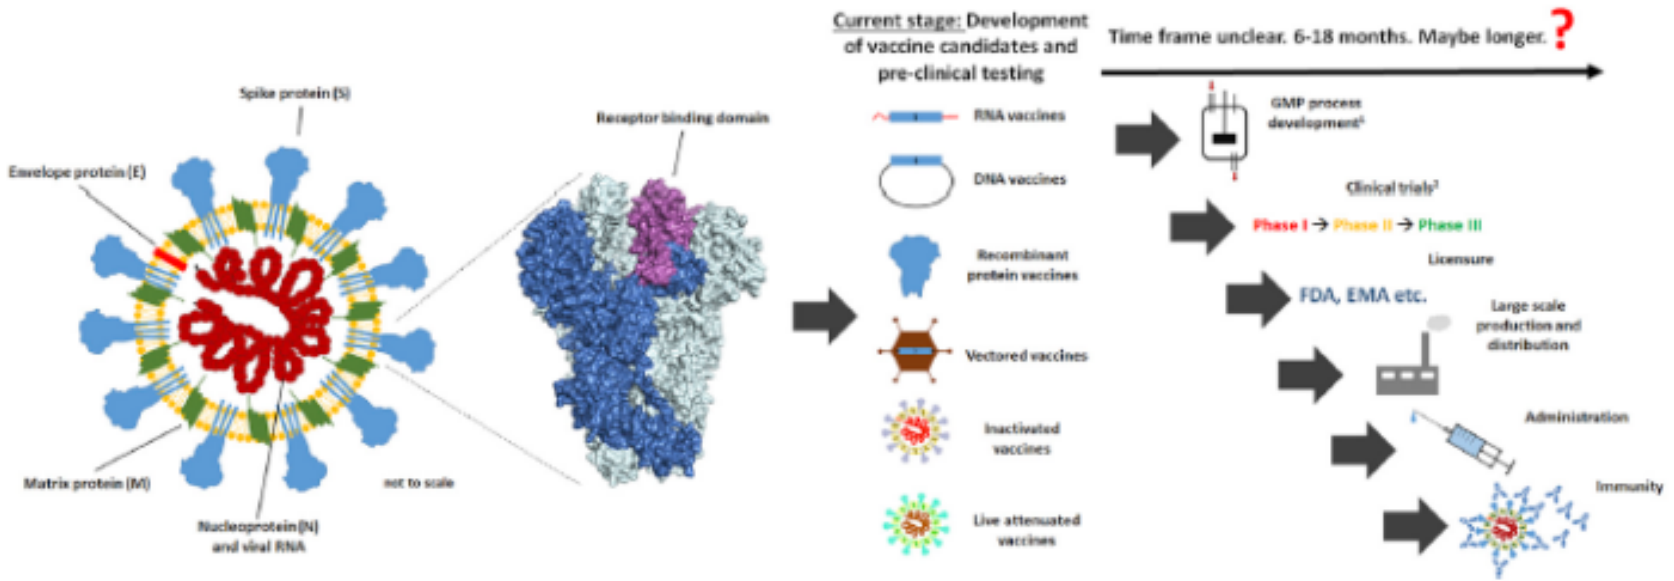

Figure 1. Overview of Potential SARS-CoV-2 Vaccine Platforms

The structure of a coronavirus particle is depicted on the left, with the different viral proteins indicated. The S protein is the major target for vaccine development. The spike structure shown is based on the trimeric SARS-CoV-1 spike (PDB: 5XL3). One trimer is shown in dark blue, and the receptor binding domain, a main target of neutralizing antibodies, is highlighted in purple. The other two trimers are shown in light blue. SARS-CoV-2 vaccine candidates based on different vaccine platforms have been developed, and for some of them, pre-clinical experiments have been initiated. For one mRNA-based candidate, a clinical trial recently started to enroll volunteers shortly (ClinicalTrials.gov: NCT04283461). However, many additional steps are needed before these vaccines can be used in the population, and this process might take months, if not years. [1]For some candidates, cGMP processes have already been established. [2]Clinical trial design might be altered to move vaccines through clinical testing quicker.

Amanat F et al. Immunity 2020

Table 1: Impact of disease modifying antirheumatic drugs on vaccine immunogenicity:

	Influenza	Pneumococcal	Herpes Zoster	Hepatitis B	Human papilloma virus	Tetanus	SARS-CoV-2 (mRNA)
Methotrexate	↓[14 22 24]	↓[49 50]	OK (ZVL)[51]		OK [113 128 129]	↓[117]	↓[78 80 81]
TNF-inhibitors	OK[14 16 20 27 28]	OK[14 55]	OK (ZVL) [60]	↓[99-101]	OK [113 128]	OK[117 120*]	OK [80 81 84]
Rituximab	↓↓[14-17 19-21 24 130]	↓↓[14 18 44-46]	OK T-cell response (RZV)[61]			↓[18 117]	↓↓[77 78-80]
Abatacept	↓[24 26]	↓[44 45]				OK (SQ) [118] ↓(IV)[119]	↓[80]
JAK-inhibitor	OK[30]	↓[30]				OK (tofacitinib)[116] ↓(baricitinib)[52]	↓[78 80]
IL-6R inhibitor	OK[31]	OK[31]				OK[121]	OK[80]
IL-12/23 inhibitor	OK[32]	OK[53]		↓[101]		OK[53]	OK [78]
IL-17 inhibitor	OK[33-35]	OK[54]				OK[54]	OK[80]

OK: No significant/meaningful effect on vaccine immunogenicity (may include reduction in absolute post-vaccination titers if rates of protective titers are unchanged.) ↓: Reduces vaccine immunogenicity. ↓↓: Significantly reduces vaccine immunogenicity. For OK, ↓, and ↓↓: if no control group is available, data are compared to expected vaccine responses in the general population.
Empty cells indicate a lack of data.
TNF = tumor necrosis factor, JAK = Janus kinase, IL = interleukin, ZVL = zoster vaccine live, RZV = recombinant zoster vaccine, SQ = subcutaneous

Quillaja saponaria

1. Rationale

IMID patients / IMID treatments = higher risk of zoster
Recombinant Zoster Vaccine: available, high efficacy, new adjuvant
Adjuvant → **Theoretical risk of flares after vaccine**

Are rheumatology patients at **higher risk of flares** after RZV?

2. Study

Retrospective single-center study (Rheumatology, CCF, USA)
Inclusion: ≥1 RZV dose between Feb. 2018 and May 2020
Data extracted from Electronic Medical Records

- **Flares in the 12-week period after each dose? Risk factors?**
- **Adverse events? Zoster outbreak?**

3. Results

n=622 rheumatology patients
n=359 IMID patients

67% female
Median age 67 yo
77% received 2 doses
8.7% adverse events
Median f/u = 36 weeks

Which IMID/treatment? Flared after RZV?

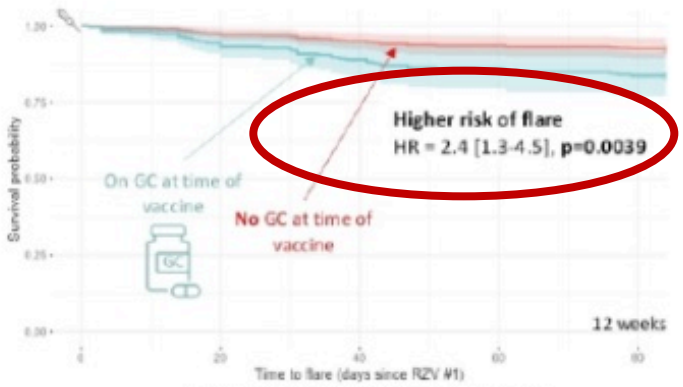
Description

IMID subgroups	Total from IMID (n=359)	On GC n=125 (35%)	≥1 Flare n=59 (16%)
RA	88 (25%)	37 (42%)	21 (24%)
Vasculitis	50 (14%)	23 (46%)	5 (10%)
PMR	29 (8%)	21 (72%)	5 (17%)
Gout	28 (8%)	3 (11%)	5 (18%)
SLE	24 (7%)	10 (42%)	4 (17%)

Flares: n=59
A change in IS treatment was needed in 25%

Logistic regression

Risk factor	No flare (n=300)	Flare (n=59)	Univariate p-value	Multivariate OR [IC95]	p-value
RA	67 (22%)	21 (36%)	**0.030**	1.57 [0.8-3]	0.173
GC	31%	53%	**0.002**	2.31 [1.3-4]	**0.004**
Jak-i	4%	10%	**0.032**	2.09 [0.6-6]	0.203



Survival analysis (multivariate Cox-model)

Key messages

- ✓ RZV appears safe in IMID patients
- ✓ GC at time of vaccine = higher risk of flare
- ✓ Patient + Provider discussion
- ✓ Informed consent
- ✓ Benefits / Risks Balance

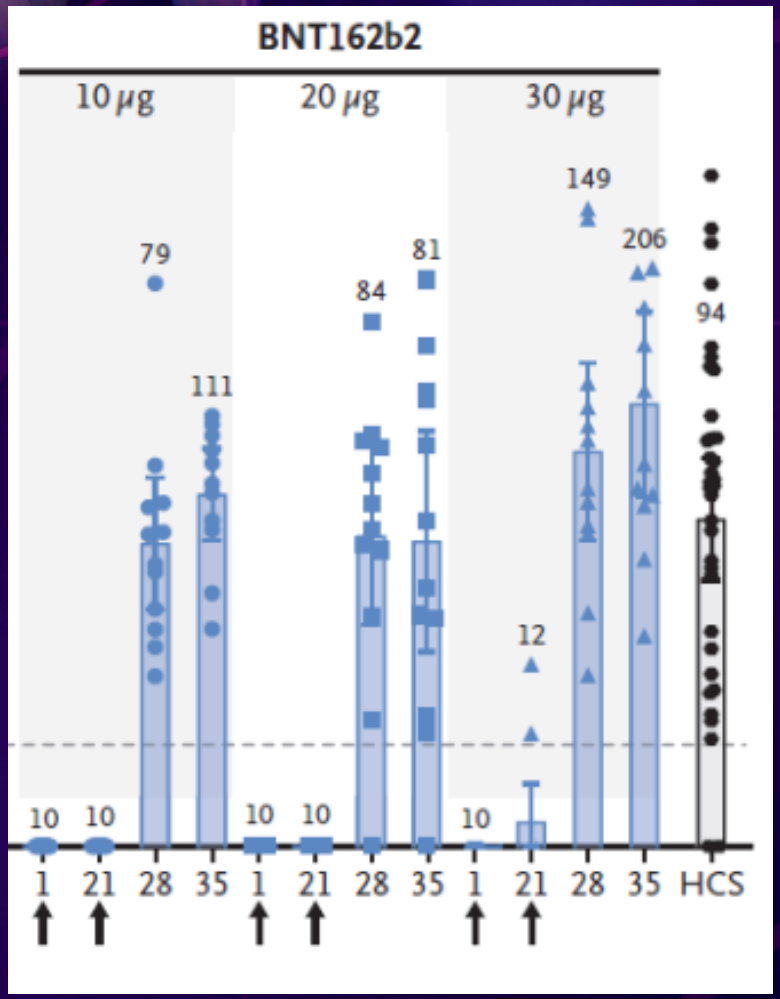
Pfizer mRNA vaccine (BNT162b2)

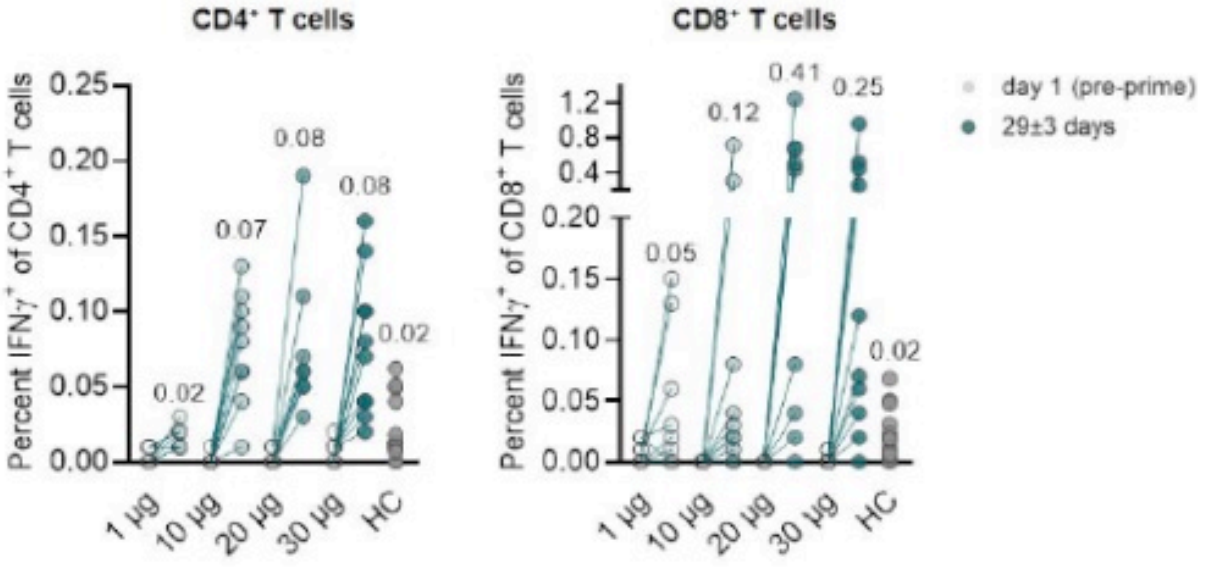


65-85 years old

Walsh E et al NEJM 2020

Cell-mediated Responses

Figure 2. Frequency and Magnitude of BNT162b2-induced CD4⁺ and CD8⁺ T Cell Responses



PBMCs of BNT162b2-immunized participants were obtained on Day 1 (pre-prime) and on Day 29 (7 days post dose 2) (cohorts 1 µg, n=8; 10 and 30 µg, n=10; 20 µg, n=9) and COVID-19-recovered human convalescent donors (HC, n=18) were stimulated overnight with an overlapping peptide pool representing the N-terminal portion of the wild-type sequence of SARS-CoV-2 S protein (S pool 1 [aa 1-643]) and were analyzed by intracellular cytokine staining flow cytometry analysis. Frequency of S-specific CD4+ and CD8+ T cells producing IFNγ in response to S pool 1 as a fraction of total circulating CD4 and CD8 T cells are shown. Numbers indicated in the graphs are the arithmetic mean fractions.

HZ with COVID-19 and mRNA Vaccine

Figure 1 Grouped vesicles on the dorsum over an erythematous background

Methods:

The safety of the BNT162b2 mRNA vaccination was assessed in an observational study monitoring post-vaccination adverse effects in patients with AIIRD (n=491) and controls (n=99), conducted in two Rheumatology Departments in Israel.

Results:

The prevalence of HZ was 1.2% (n=6) in patients with AIIRD compared to none in controls. Six female patients aged 49±11 years with stable AIIRD: rheumatoid arthritis (n=4), Sjogren's syndrome (n=1), and undifferentiated connective disease (n=1), developed the first in a lifetime event of HZ within a short time after the first vaccine dose in 5 cases and after the second vaccine dose in one

Table 3: Guidance Related to the Use and Timing of Vaccination and Immunomodulatory Therapies in Relation to COVID-19 Vaccination in RMD Patients*

Medication	Timing Considerations for Immunomodulatory Therapy and Vaccination*	Level of Task Force Consensus
Hydroxychloroquine; apremilast; IVIG; glucocorticoids, prednisone-equivalent dose <20mg/day	No modifications to either immunomodulatory therapy or vaccination timing	Strong-Moderate
Sulfasalazine; Leflunomide; Azathioprine; Cyclophosphamide (oral); TNFi; IL-6R; IL-1; IL-17; IL-12/23; IL-23; Belimumab; Glucocorticoids, prednisone-equivalent dose ≥ 20mg/day†	No modifications to either immunomodulatory therapy or vaccination timing	Moderate
Mycophenolate; **oral calcineurin inhibitors**	Assuming that disease is stable, hold for 1 week following each vaccination	Moderate
Methotrexate	Hold MTX for 1 week after each of the 2mRNA vaccine doses, for those with well-controlled disease; no modifications to vaccination timing	Moderate
Methotrexate	Hold MTX for 2 weeks after single-dose COVID vaccination, for those with well-controlled disease	Moderate
JAKi	Hold JAKi for 1 week after each vaccine dose; no modification to vaccination timing	Moderate
Abatacept SQ	Hold SQ abatacept both one week prior to and one week after the first COVID-19 vaccine dose (only); no interruption around the second vaccine dose	Moderate
Abatacept IV	Time vaccine administration so that the first vaccination will occur four weeks after abatacept infusion (i.e., the entire dosing interval), and postpone the subsequent abatacept infusion by one week (i.e., a 5-week gap in total); no medication adjustment for the second vaccine dose	Moderate
Cyclophosphamide IV	Time CYC administration so that it will occur approximately 1 week after each vaccine dose, when feasible	Moderate
Rituximab	Assuming that patient's COVID-19 risk is low or is able to be mitigated by preventive health measures (e.g., self-isolation), schedule vaccination so that the vaccine series is initiated approximately 4 weeks prior to next scheduled rituximab cycle; after vaccination, delay RTX 2-4 weeks after final vaccine dose, if disease activity allows	Moderate
Acetaminophen, NSAIDs	Assuming that disease is stable, hold for 24 hours prior to vaccination (no restrictions on use post vaccination to treat symptoms)	Moderate
Supplemental Dosing (i.e., booster dose)		
All immunomodulatory or immunosuppressive therapies‡	**Except for glucocorticoids and anti-cytokine therapies (see footnote), hold all immunomodulatory or immunosuppressive medications for 1-2 weeks after booster vaccination, assuming disease activity allows.**	**Moderate**
Rituximab§	**Patients on rituximab or other anti-CD20 medications should discuss the optimal timing with their rheumatology provider before proceeding with booster vaccination.**	**Strong**

Considerations for Rheum Patients

- B cell depletion therapies and COVID vaccination
  - Time to hold the next dose?
- Needed studies
  - Vaccine responses modified by DMARDs?
  - Length of vaccine protection?
  - Co-Administration studies
- How long for mask wearing and avoidance?
  - 2022 looks to be full of travel (maybe)

OBSERVATIONS: CASE REPORTS

Safety and Immunogenicity of a Third Dose of SARS-CoV-2 Vaccine in Solid Organ Transplant Recipients: A Case Series

We repeated antibody testing a median of 14 days (IQR, 14 to 17 days) after the third dose of vaccine. Of the 6 patients with low-positive antibody titers before the third dose, all had high-positive antibody titers after the third dose. In contrast, of the 24 patients with negative antibody titers before the third dose, only 6 (25%) had high-positive antibody titers after the third dose. Two (8%) had low-positive antibody titers, and 16 (67%) remained negative.

mRNA Vaccine Real World Efficacy

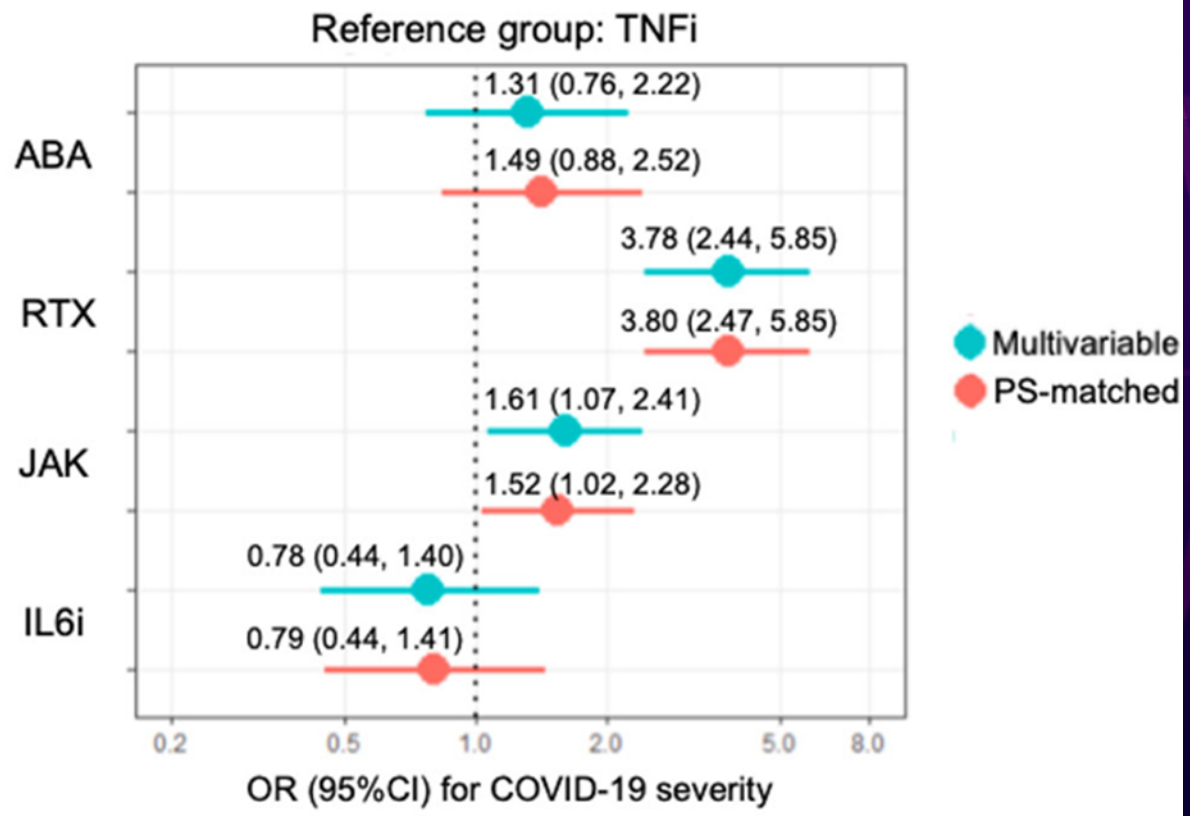
TABLE 2. Person-days, SARS-CoV-2 infections, and vaccine effectiveness among health care personnel, first responders, and other essential and frontline workers, by messenger RNA immunization status — eight U.S. locations, December 14, 2020–March 13, 2021

		SARS-CoV-2 infections		Unadjusted vaccine effectiveness*	Adjusted vaccine effectiveness*,†
COVID-19 immunization status	Person-days	No.	Incidence rate per 1,000 person-days	% (95% CI)	% (95% CI)
Unvaccinated	116,657	161	1.38	N/A	N/A
Partially immunized	41,856	8	0.19	82 (62–91)	80 (59–90)
≥14 days after receiving first dose only§	15,868	5	0.32		
≥14 days after first dose through receipt of second dose	25,988	3	0.12		
Fully immunized					
≥14 days after second dose	78,902	3	0.04	91 (73–97)	90 (68–97)

Abbreviations: CI = confidence interval; N/A = not applicable.
* Vaccine effectiveness was estimated using a Cox proportional hazards model accounting for time-varying immunization status.
† Hazard ratio is adjusted for study site.
§ Participants received first dose but had not received second dose by the end of the study period.

https://www.cdc.gov/mmwr/volumes/70/wr/mm7013e3.htm?s_cid=mm7013e3_x

Figure. Odds ratios for the ordinal COVID-19 severity outcome for patients with RA on biologic or targeted synthetic DMARDs (n=1673).



The effect size is the odds of being one level higher on the ordinal scale than the reference group.

n for propensity score (PS)-matched analyses: 98 ABA and 525 TNFi; 127 RTX and 520 TNFi; 198 JAK and 527 TNFi; 107 IL6i and 525 TNFi.

Multivariable covariates and propensity score included age, sex, region, season, smoking, obesity, RA disease activity, interstitial lung disease, cancer, comorbidity count, concomitant non-biologic DMARD use, and glucocorticoid use/dose.
